

IN THE CLAIMS:

Following are the claims as amended herein and as are currently pending for consideration:

1. (Currently Amended) A docking station comprising:

an set of apertures on a top surface of the docking station to align with an set of apertures on a bottom surface of a computer system, when the computer system is docked, the set of apertures on the computer system having doors that remain closed when the computer system is undocked; and

a convection unit to remove internal ambient air to reduce internal ambient air temperature when the computer system is docked, the convection unit forces air into the computer system when the computer system is docked; wherein the docking station includes a cooling unit to generate air to be forced into the computer system that is of a lower temperature compared to an ambient air temperature within said computer system.

3. (Previously Presented) The docking station of claim 1, wherein the convection unit is to exhale air from the computer system when the computer system is docked.

6. (Currently Amended) A computer system comprising:

a first set of apertures on a bottom surface of the computer system to align with an a second set of apertures on a top surface of a docking station when the

computer system is docked, the set of apertures on the computer system having doors that remain closed when the computer system is undocked, the first set of apertures providing an air passage way for air movement generated by a convection unit in the docking station, wherein the air forced into the computer system from the docking station is at a temperature lower than an ambient temperature within the computer system, the docking station having a cooling unit.

9. (Previously Presented) The computer system of claim 6, wherein the first aperture of the computer system releases air movement in response to the convection unit in the docking station exhaling air from within the computer system.

11. (Currently Amended) A method of cooling a computer system comprising:

receiving a docking of a computer system;

aligning a set of apertures on a top surface of a docking station with a set of apertures on a bottom surface of the computer system, the set of apertures on the computer system having doors that remain closed when the computer system is undocked;

a convective unit in the docking station removing internal ambient air from the computer system when the computer system is docked;

the docking station removing internal ambient air from the computer system when the computer system is docked by the docking station exhaling air from within the computer system; and

providing air to the computer from the docking station at a temperature lower than an ambient temperature within the computer system, the temperature of the air provided to the computer is reduced by a cooling unit within the docking station.

12. (Previously Presented) The method of claim 11, further including:

the docking station removing internal ambient air from the computer system when the computer system is docked by the docking station forcing air into the computer system.

15. (Previously Presented) The method of claim 11, further including:

reducing an internal temperature of the computer system via air movement generated by the convection unit of the docking station.
